

MILLSOFTWARE

Expert Software Engineers

In a challenging technology environment you need an experienced partner.

Finding the right software engineering partner is critical and while we choose not to shout about ourselves, our industry experience and expertise speaks volumes.

## We make it easy.

We've been developing embedded software across a range of industries for over 10 years, working with local and international Telcos, global brands like Hewlett-Packard, and Bosch, as well as clients needing anything from a Carrier Ethernet test solution to a customised iPhone app.

We pride ourselves on being customer focused, delivering commercially viable solutions that are cost effective and time efficient.

## From start to finish.

We don't add complexity for complexity's sake or charge for a range of features you'll never need. After all, it's our job to make your job smoother and easier.

We assign project teams to each client so a select group of experts manage the job from beginning to end.

Our approach means we deliver:

- Lower costs and reduced complexity
- Faster times to market
- Simplified product development
- Greater and more effective interaction between technologies
- Risk management and mitigation
- Higher functioning applications

Of course, that doesn't mean we compromise any of the security, robustness or functionality of our products.

Whether you are integrating enterprise solutions or developing consumer electronics that provide and enhance the consumer experience, all care is taken to ensure the best possible result.

We enhance the user experience and champion the best business tools delivering commercial outcomes.

1. Application Development
2. Managed Services
3. Support and Help Desk Services.

We're fluent in a wide range of languages, technologies, platforms, operating systems and frameworks including Window's, MacOS, Linux, iPhone, Web and various ARM based embedded devices.

Our flat operating structure means clients always have access to the software developers and senior personnel handling their project.

We create specific project teams that take responsibility for the job from start to finish. This in turn promotes product innovation, greater satisfaction and stronger long-term relationships.

Our teams are highly regarded for their ability to create real world commercial solutions under challenging timeframes or environments. Our ability to draw on both in-house and external specialists means the right set of skills are matched to each individual project.

**A team you  
can call on  
and count on.**

Nick Bonnett  
Managing Director

Nick Bonnett leads Mill Software with over 15 years experience managing the development of embedded software across a range of industries including telecommunications, commercial applications, business devices and tools and consumer electronics.

Nick holds a BA Engineering (Electrical) – First Class Honors and has led Mill Software to work with corporations such as; major Telcos, IBM, Hewlett-Packard and Bosch as well as a number of medium size organisations seeking to develop new and existing products and technologies.

We have significant experience in the Telecommunications Industry, working with major Telcos both locally and internationally.

We have long term relationships in the B2B space, providing development and support services for internationally distributed networked solutions over 3G and fixed line enterprise networks.

We have worked on defence systems and technologies and can create sophisticated management and reporting tools.

And for consumer electronics, our priority is to enhance the user experience and simplify the product interface.
